

FIGURE 25e-31 Numerous varicella lesions at various stages of evolution: vesicles on an erythematous base and umbilicated vesicles, which then develop into crusting lesions. (Courtesy of the Centers for Disease Control and Prevention.)

FIGURE 25e-32 Lesions of disseminated zoster at different stages of evolution, including pustules and crusting, similar to varicella. Note nongrouping of lesions, in contrast to herpes simplex or zoster. (Reprinted from K Wolff, RA Johnson, AP Saavedra: *Color Atlas and Synopsis of Clinical Dermatology*, 7th ed. New York, McGraw-Hill, 2013.)

FIGURE 25e-33 Herpes zoster is seen in this patient taking prednisone. Grouped vesicles and crusted lesions are seen in the T2 dermatome on the back and arm (**A**) and on the right side of the chest (**B**). (Reprinted from K Wolff, RA Johnson: *Color Atlas and Synopsis of Clinical Dermatology*, 6th ed. New York, McGraw-Hill, 2009.)
