

FIGURE 441e-5 Histoplasmosis of the pons (Chap. 236). Axial FLAIR (A) and T2-weighted (B) MRIs demonstrate a low signal mass in the right pons (arrows) with surrounding vasogenic edema. Axial T1-weighted MRI postgadolinium (C) demonstrates ring enhancement of the lesion in the right pons (arrow). Of note, there was no evidence of restricted diffusion (not shown).
