

FIGURE 76e-58 Disseminated gonococemia in the skin is seen as hemorrhagic papules and pustules with purpuric centers in an acral distribution. (Courtesy of Daniel M. Musher, MD; with permission.)

FIGURE 76e-60 Discoid lupus erythematosus. Atrophic, depigmented plaques and patches surrounded by hyperpigmentation and erythema in association with scarring and alopecia are characteristic of this cutaneous form of lupus.

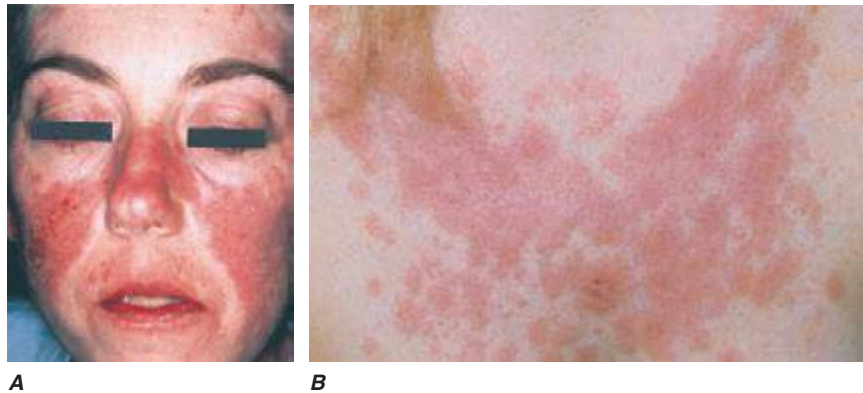

FIGURE 76e-59 Lupus erythematosus. **A.** Systemic lupus erythematosus, with prominent, scaly malar erythema. Involvement of other sun-exposed sites is also common. **B.** Acute lupus erythematosus on the upper chest, with brightly erythematous and slightly edematous coalescence of papules and plaques. (B: Courtesy of Robert Swerlick, MD; with permission.)

FIGURE 76e-61 Dermatomyositis. Periorbital violaceous erythema characterizes the classic heliotrope rash. (Courtesy of James Krell, MD; with permission.)
