

FIGURE 76e-62 Scleroderma characterized by typical expressionless, mask-like facies.

FIGURE 76e-65 Erythema multiforme is characterized by multiple erythematous plaques with a target or iris morphology and usually represents a hypersensitivity reaction to drugs or infections (especially herpes simplex virus). (Courtesy of Yale Resident's Slide Collection; with permission.)

FIGURE 76e-63 Scleroderma, with acral sclerosis and focal digital ulcers.

FIGURE 76e-66 Dermatitis herpetiformis, manifested by pruritic, grouped vesicles in a typical location. The vesicles are often excoriated and may also occur on the knees, buttocks, elbows, and posterior scalp.

FIGURE 76e-64 Dermatomyositis often involves the hands as erythematous flat-topped papules over the knuckles (Gottron's sign) and periungual telangiectasias.
