disorders, asymptomatic patients should be advised that a positive test result does not always translate into future disease development. In addition, the role of nongenetic factors, such as environmental exposures and lifestyle, must be discussed in the context of multifactorial disease risk and disease prevention. Finally, patients should understand the natural history of the disease as well as the potential options for intervention, including screening, prevention, and in certain circumstances, pharmacologic treatment or prophylactic surgery.

THERAPEUTIC INTERVENTIONS BASED ON GENETIC RISK FOR DISEASE

Specific treatments are available for a number of genetic disorders. Strategies for the development of therapeutic interventions have a long history in childhood metabolic diseases; however, these principles have been applied in the diagnosis and management of adult-onset diseases as well (Table 84-2). Hereditary hemochromatosis is usually caused by mutations in *HFE* (although other genes have been less commonly associated) and manifests as a syndrome of iron overload, which can lead to liver disease, skin pigmentation, diabetes mellitus, arthropathy, impotence in males, and cardiac issues (Chap. 428). When identified early, the disorder can be managed effectively with therapeutic phlebotomy. Therefore, when the diagnosis of hemochromatosis has been made in a proband, it is important to counsel and offer testing to other family members in order to minimize the impact of the disorder.

Preventative measures and therapeutic interventions are not restricted to metabolic disorders. Identification of familial forms of long QT syndrome, associated with ventricular arrhythmias, allows early electrocardiographic testing and the use of prophylactic antiarrhythmic therapy, overdrive pacemakers, or defibrillators. Individuals with familial hypertrophic cardiomyopathy can be screened by ultrasound, treated with beta blockers or other drugs, and counseled about the importance of avoiding strenuous exercise and dehydration. Those with Marfan's syndrome can be treated with beta blockers or

TABLE 84-2 EXAMPLE OF GENETIC TESTING AND POSSIBLE INTERVENTIONS

Genetic Disorder	Inheritance	Genes	Interventions
Oncologic			
Lynch syndrome (HNPCC)	AD	*MLH1, MSH2, MSH6, PMS2*	Early endoscopic screening; risk-reducing surgery
Familial adenomatous polyposis	AD	*APC*	Early and frequent endoscopy; prophylactic colectomy
Hereditary breast and ovarian cancer	AD	*BRCA1, BRCA2*	Risk reducing salpingo-oophorectomy; intensified breast surveillance including breast MRI; risk-reducing mastectomy
Hereditary diffuse gastric cancer	AD	*CDH1*	Prophylactic gastrectomy; enhanced breast cancer surveillance
Hematologic			
Factor V Leiden	AD	*F5*	Avoidance of thrombogenic risk factors
Hemophilia A	XL	*F8*	Factor VIII replacement
Hemophilia B	XL	*F9*	Factor IX replacement
Glucose 6-phosphate dehydrogenase deficiency	XL	*G6PD*	Avoidance of oxidant drugs and certain foods
Cardiovascular			
Hypertrophic cardiomyopathy	AD	>10 genes including *MYBPC3, MYH7, TNNT2, TPM1*	Echocardiographic screening; pharmacologic intervention; myomectomy
Long QT syndrome	AD, AR	>10 genes including *KCNQ1, SCN5A, KCNE1, KCNE2*	Electrocardiographic screening; pharmacologic intervention; implantable cardiac defibrillator devices
Marfan's syndrome	AD	*FBN1*	Echocardiographic screening; prophylactic beta blockers; aortic valve replacement as indicated
Gastrointestinal			
Familial Mediterranean fever	AR	*MEFV*	Colchicine
Hemochromatosis	AR	*HFE*	Phlebotomy
Pulmonary			
α_1 Antitrypsin deficiency	AR	*SERPINA1*	Avoidance of smoking and occupational and environmental toxins
Cystic fibrosis	AR	*CFTR*	Chest physiotherapy; agents to promote airway secretion clearance; *CFTR* modulators (G551D mutations); lung transplantation
Endocrine			
Neurohypophyseal diabetes insipidus	AD	*AVP*	Replace vasopressin
Familial hypocalciuric hypercalcemia	AD	*CASR*	Avoidance of parathyroidectomy
Multiple endocrine neoplasia type 2	AD	*RET*	Prophylactic thyroidectomy; screening for pheochromocytoma and hyperparathyroidism
Renal			
Polycystic kidney disease	AD, AR	*PKD1, PKD2, PKHD1*	Prevention of hypertension; prevention of urinary tract infections; kidney transplantation
Nephrogenic diabetes insipidus	XL, AR	*AVPR2, AQP2*	Fluid replacement; thiazides with or without amiloride
Neurologic			
Malignant hyperthermia	AD	*RYR1, CACNA1S*	Avoidance of precipitating anesthetics
Hyperkalemic periodic paralysis	AD	*SCN4A*	Diet rich in calcium and low in potassium; thiazides or acetazolamide
Duchenne's and Becker's muscular dystrophy	XL	*DMD*	Corticosteroids; physical therapy
Wilson's disease	AR	*ATP7B*	Zinc, trientene

Abbreviations: AD, autosomal dominant; AR, autosomal recessive; HNPCC, hereditary nonpolyposis colorectal cancer; MRI, magnetic resonance imaging; XL, X-linked.
